

Even more convenient opening and closing

blueMatic EAV4

The motorised automatic locking system

Automatic closing. Motorised opening.

The convenient way to secure your home

With blueMatic EAV4 from Winkhaus, your entrance door closes practically by itself – automatically when you leave the house. When you get home, a motor takes over: It retracts the solid hooks with the sealing elements and allows you to enter. Your door recognises you – as requested by you, for example by your face, your fingerprint or your electronic key. Of course, you can also operate the locking system using a mechanical key or from the inside via the door handle.

State-of-the-art technology

blueMatic EAV4 fits all common access control systems that pass on a potential-free opening signal to the locking system. Whether finger scanner, intercom system or just a button – blueMatic EAV4 unlocks at your request. A holiday lockout function provides even more security during your absence. It blocks the handle from the inside and prevents unauthorised persons from leaving the house without a key. It also prevents small children from running onto the road during an unsupervised moment.

Convenient daytime releases

In addition, all Winkhaus automatic locking systems can be equipped with a practical TaFa daytime latch. This is useful, for example when carrying in your purchases. It can be mechanically activated very easily with a single movement and is used to hold open the door temporarily, similar to a proven electrical door opener. The hooks remain retracted when the door closes. This allows the door to be opened with just one hand. When the switch is reset to night mode, the door is reliably locked again.

High performance

The strong 24 V motor is integrated in the lock case of your door locking system. It is powerful enough to supply conventional access control systems and the blueMatic EAV4 with power simultaneously. Separable cable transitions and plug-and-play solutions make it easier to connect a finger scanner (ekey dLine, IDENCOM BioKey INSIDE or Sommer ENTRAsys+) or other identification components.

Winkhaus Plus

- + Integrated motor for convenient unlocking
- + Suitable for all frame materials
- + For all common access systems
- + Automatic locking by means of magnet technology on the frame side
- + High security standard (suitable for RC2)
- + Plug-and-play components for easy fitting
